background position property

5 minutes ago

The CSS `background-position` property sets the initial position of a background image within an element's content, padding, and border area. By default, a background image is placed at the top-left corner (0% 0%) of an element. [↗](#)

Syntax

The property accepts values in keywords, percentages, or length units (e.g., pixels, ems). [↗](#)

CSS

`background-position: value1 value2;`

Use code with caution.

- `value1` : Sets the horizontal position (x-axis).
- `value2` : Sets the vertical position (y-axis). [↗](#)

If only one value is specified, the other value is automatically set to `center` (or 50%). [↗](#)

Property Values

You can use various value types to control positioning: [↗](#)

Keywords

Keywords are the most readable and common way to position an image. [↗](#)

- Horizontal:** `left` , `center` , `right`
- Vertical:** `top` , `center` , `bottom`

Examples:

- `background-position: top right;` (Same as `right top`).
- `background-position: center center;` (Centers the image both horizontally and vertically).

and 100px from the top).

- `background-position: 30px;` (Positions 30px from the left, `center` vertically).

Percentages

Percentages (`%`) define the position as a percentage of the container's dimensions relative to the corresponding point on the background image itself.

- `background-position: 25% 75%;` (Aligns the point 25% across and 75% down on the image with the point 25% across and 75% down in the container).
- `background-position: 50% 50%;` (Centers the image; equivalent to `center center`).

Shorthand Properties

For more granular control over individual axes, you can use the non-shorthand properties:

- `background-position-x` : Sets the horizontal position.
- `background-position-y` : Sets the vertical position.

The `background-position` property can also be used as part of the composite `background` shorthand property. You can find more details on using these properties on [MDN Web Docs](#) or [W3Schools](#).
