

The 2 issues are solved of the calendar image using Grid , group selector not used in css, css rule is used separately.(2nd issue is solved by using `grid-template-rows: repeat(6,30px);` instead of using `grid-template-rows: repeat(6,1fr);` and the 1st issue is solved by using the `grid-gap:2px`(absolute unit); instead of using the `grid-gap:2%` (relative unit)). *** for the 1st issue ,it happened because the width and height of the screen was not equal so when we used `grid-gap:2%` , it gave uneven gap in column and rows, so it's easily solved using absolute units.and for the 2nd issue , the images were a bit stretched vertically , it happened because the height of the viewport was larger then the width, so when we used `grid-template-rows: repeat(6,1fr)` , the 1fr height becomes larger than 1fr width , so the images also becomes vertically bit stretched , so it's solved using a absolute unit.the absolute unit was not used in the column section as the scrolling width is fixed for a particular device so responsiveness(1fr) is applied here, the relative unit was used in the rows as the scrolling height is infinity for every device so responsiveness is not needed here(30px).
