

Optional improvement (very common)

If the image looks too big on mobile, add `background-size` :

CSS

Copy code

```
@media screen and (max-width:576px) {
  header {
    background: url("../images/header_bg.png"), #FFF8F3;
    background-position: bottom right;
    background-repeat: no-repeat;
    background-size: 250px; /* try values like 200px, 250px, cover */
  }
}
```

If you tell me what problem you see on mobile (image cut off / too big / overlaps text), I'll suggest the best `background-size` and `position` values.

```
header {
  background-color: #FFF8F3;
  background: url("../images/developer.png"),
url("../images/header_bg.png"), #FFF8F3;
  background-position: 23px 38px, bottom right;
  background-repeat: no-repeat;
  padding-top: 50px;
}

@media screen and (max-width:576px) {

  header {
    background-color: #FFF8F3;
    background: url("../images/header_bg.png"), #FFF8F3;
    background-position: bottom right;
    background-repeat: no-repeat;
  }

}
```

now my question is that , for @media screen and (max-width:576px)

is the background-repeat: no-repeat; property necessary again as it is already added before??

No — it’s **not necessary** to write `background-repeat: no-repeat;` again **unless you changed it**.

Why?

CSS follows:

- 1. **Inheritance** (only some properties inherit — backgrounds do **not** inherit)
- 2. **Cascade / override** (later rules override earlier ones)
- 3. **Shorthand resets**

In your case:

- In the main `header` you set:

cssCopy code

```
background-repeat: no-repeat;
```

- In the media query you did **not** change `background-repeat` .

So **on mobile it will still be** `no-repeat` even if you don’t write it again.

✔ You can remove it:

cssCopy code

```
@media screen and (max-width:576px) {
  header {
    background: url("../images/header_bg.png"), #FFF8F3;
    background-position: bottom right;
    /* background-repeat is still no-repeat from above */
  }
}
```

But here’s the important exception (when you DO need it)

When you use the **background shorthand**, it can reset sub-properties.

Example:

cssCopy code

```
@media (max-width:576px) {
  header {
    background: url("../images/header_bg.png") #FFF8F3;
    /* This shorthand sets image + color, and can reset repeat/position/si
  }
}
```

Default for `background-repeat` is **repeat**.

So to be 100% safe, many people re-add it when using shorthand, like:

CSS

Copy code

```
@media (max-width:576px) {
  header {
    background: url("../images/header_bg.png"), #FFF8F3;
    background-repeat: no-repeat; /* safe */
    background-position: bottom right; /* safe */
  }
}
```

Best practice (easy rule)

- If you use `background:` shorthand inside media query, it’s smart to also include:
 - `background-repeat`
 - `background-position`
 - (and sometimes `background-size`)

So: **Not required**, but **good safety** when using `background:` shorthand.

If you want, I can show you a “cleanest” version using `background-image` instead of shorthand so nothing gets reset.

what do you mean by shorthand??

In CSS, **shorthand** means **one property that sets multiple related properties at the same time**.

Example: `background` is a shorthand

Instead of writing many lines:

CSS

Copy code

```
header{
  background-image: url("a.png");
  background-color: #FFF8F3;
  background-repeat: no-repeat;
  background-position: bottom right;
}
```

You can write **one shorthand line**:

CSS

Copy code

```
header{
  background: url("a.png") no-repeat bottom right #FFF8F3;
}
```

That single `background:` line is shorthand because it can include:

- image
 - repeat
 - position
 - color
 - size (with /)
- ...and more.

Why shorthand can confuse people

Because when you write a shorthand again later, it can **reset** other background settings back to default.

Example (your case)

You had this before:

cssCopy code

```
header{
  background-repeat: no-repeat;
}
```

Then in mobile you wrote:

cssCopy code

```
@media (max-width:576px){
  header{
    background: url("header_bg.png"), #FFF8F3;
  }
}
```

Because you used `background:` shorthand again, the browser may reset:

- `background-repeat` → default (`repeat`)
 - `background-position` → default (`0 0`)
- unless you set them again.

That’s why people often repeat:

cssCopy code

```
background-repeat: no-repeat;
background-position: bottom right;
```

Another common shorthand example: `margin`

Instead of:

cssCopy code

```
margin-top: 10px;
margin-right: 20px;
margin-bottom: 10px;
margin-left: 20px;
```

You can do:

css Copy code

```
margin: 10px 20px;
```

That’s shorthand too.

Quick tip

If you want to avoid resetting problems, you can use longhand:

css Copy code

```
@media (max-width:576px){
  header{
    background-image: url("../images/header_bg.png");
    background-color: #FFF8F3;
  }
}
```

This way your earlier `background-repeat: no-repeat;` will safely remain.

If you want, I can rewrite your full header CSS in the “best practice” way (no reset issues).
