

how to change a logo's color into gray in html?

It depends on what kind of “logo” you have in HTML:

- **SVG logo** (best/easiest) ✓ → you can change color with CSS
- **PNG/JPG logo image** ✗ → you can’t truly “re-color” it with CSS, but you *can* make it look gray using filters
- **Icon font** (Font Awesome etc.) ✓ → change with `color`

Below are the common ways.

1) If your logo is an SVG (recommended)

✓ **Inline SVG** (you can style it directly)

html

📄 Copy code

css

📄 Copy code

```
.logo path {
  fill: gray; /* or #777 */
}
```

If the SVG uses `stroke` lines:

css

📄 Copy code

```
.logo path {
  stroke: gray;
}
```

✓ **SVG file in `<img>` tag**

If it’s like:

html

📄 Copy code

```

```

You **can’t reliably change the internal SVG color** with CSS in this form.

Solution: use **inline SVG** (best) or embed it as `<object>` / `<iframe>` (more advanced).

2) If your logo is a PNG/JPG (most common)

 Make it *look* gray with CSS filter

html

Copy code

```

```

css

Copy code

```
.logo {
  filter: grayscale(100%);
}
```

If it looks too dark/light, you can tweak:

css

Copy code

```
.logo {
  filter: grayscale(100%) brightness(0.9) contrast(1.1);
}
```

Note: This does not “change the color” pixel-perfectly—just applies a visual effect.

3) If your “logo” is text or an icon (Font Awesome, etc.)

Text logo

html

Copy code

```
<h1 class="logo-text">MyBrand</h1>
```

css

Copy code

```
.logo-text {
  color: gray;
}
```

Font Awesome icon

html

Copy code

```
<i class="fa-brands fa-github logo-icon"></i>
```

css

Copy code

```
.logo-icon {
  color: gray;
}
```

Which one are you using?

If you paste your logo HTML (just the line where you show it), I'll tell you the exact best method for your case.

explain simply in details :

2) If your logo is a PNG/JPG (most common)

✔ Make it look gray with CSS filter

```

```

```
.logo {
  filter: grayscale(100%);
}
```

If it looks too dark/light, you can tweak:

```
.logo {
  filter: grayscale(100%) brightness(0.9) contrast(1.1);
}
```

Note: This does not “change the color” pixel-perfectly—just applies a visual effect.

Sure — think of it like putting a “black & white” camera filter on your logo image.

When your logo is a **PNG/JPG**, it’s already a finished picture made of pixels. So CSS can’t *repaint* the pixels perfectly into a new color, but it **can apply effects** to the whole image. That’s what `filter` does.

What this does

✔ `filter: grayscale(100%);`

CSS

Copy code

```
.logo {
  filter: grayscale(100%);
}
```

Meaning (super simple)

- **grayscale** = remove colors
- **100%** = remove *all* colors → fully gray

So your colorful logo becomes **black/gray/white only**.

Full working example

html

Copy code

```

```

css

Copy code

```
.logo {
  width: 150px;           /* just to see size */
  filter: grayscale(100%);
}
```

Why it may look too dark or too light

After colors are removed, sometimes:

- the logo becomes **too dark** (gray looks heavy)
- or **too light** (gray looks faded)

So you can adjust the “camera settings” with:

✔ brightness + contrast

css

Copy code

```
.logo {
  filter: grayscale(100%) brightness(0.9) contrast(1.1);
}
```

What `brightness(0.9)` means

Brightness controls how light the image is.

- `brightness(1)` = normal (no change)
- `brightness(0.9)` = a little darker
- `brightness(1.2)` = brighter

Examples

css

Copy code

```
/* Brighter logo */
filter: grayscale(100%) brightness(1.2);

/* Darker logo */
filter: grayscale(100%) brightness(0.8);
```

What contrast(1.1) means

Contrast controls the difference between light and dark parts.

- contrast(1) = normal
- contrast(1.1) = a bit more contrast (sharper)
- contrast(0.8) = less contrast (more flat / soft)

Examples

CSS

Copy code

```
/* Sharper (more contrast) */
filter: grayscale(100%) contrast(1.3);

/* Softer (less contrast) */
filter: grayscale(100%) contrast(0.8);
```

Important note (what “not pixel-perfect” means)

This method doesn’t actually change the logo’s color to a specific gray code like #777 .

It just:

- removes color (grayscale)
- then adjusts light/dark (brightness/contrast)

So it’s a **visual effect**, not a “repaint this logo to #808080 exactly”.

If you need an exact gray version:

✔ best way is to export a gray logo from design tool (Figma/Photoshop) or use SVG.

Bonus: make it gray on hover only

Normal color → gray when mouse goes on it

CSS

Copy code

```
.logo:hover {
  filter: grayscale(100%);
}
```

If you tell me your logo is **dark or light** (or share the logo), I can suggest the best brightness() and contrast() values for it.
